

Southern Hemisphere - SkyWatcher SynScan Alignment Stars

Alignment stars are sorted into calendar-groups for 3-month periods through the year and visible in the hours after sunset. Stars in the northern sky (north of the ecliptic) are higher in the sky than 30° declination.

For each 3-month period there are two tables (north and south). One for stars in the northern sky and a following table for stars in the southern sky. Some stars are duplicated in adjacent 3-month lists. Stars in each table are sorted by right ascension.

Table A1 - North of the Ecliptic: January 1 to March 31 after sunset

Name	Constellation	Mag	RA: Hrs	RA: Min	Dec: Deg	Dec: Sec
